Anyone want to help OCHA Pakistan with dynamic, online charting of FTS data?

30 messages

Dear all,

OCHA Pakistan would like to create dynamic charts (and eventually maps) from data in the [Financial Tracking System](#) in relation to the [Pakistan Flood Appeal](#). The graphs would be embedded directly into [our website](#). Although it sounds easy, the hard part will be actually getting the FTS data - it is pretty much only available in PDF and XLS. If you are interested, please read the details on my Google Doc -> <https://docs.google.com/Doc?docid=0Ad0Y9gPUymOmYWpdkHY3bnFqeDY2XzIxM2Zna25kZDN6&hl=en&authkey=CKe9nvMH>

As well, I wanted to say a huge thank you to everyone who helped out with my other requests. The symbol set was converted in under 6 hours and the map of damn levels was ready in 13 hours. Truly amazing and really makes me believe in this group even more.

FYI: the damn map is embedded on our website: <http://pakresponse.info/index.php?id=10>

Cheers,

Andrej

Andrej - our team has work with Esther (OCHA, FST manager) to explore the use of Google Motion Chart and Google Vizualisation to visualize FTS data.

Jurgen, Omar, Hillel, can you assist OCHA, as needed?

Thoughts?

Thanks,

France

Subject: [CrisisMappers] Anyone want to help OCHA Pakistan with dynamic, online charting of FTS data?

To: crisis-mappers@googlegroups.com

Dear all,

OCHA Pakistan would like to create dynamic charts (and eventually maps) from data in the Financial Tracking System <<http://fts.unocha.org/>> in relation to the Pakistan Flood

Appeal<<http://fts.unocha.org/pageloader.aspx?page=emerg-emergencyDetails&emergID=15913>>.

The graphs would be embedded directly into our website<<http://pakresponse.info/>>.

Although it sounds easy, the hard part will be actually getting the FTS data - it is pretty much only available in PDF and XLS. If you are interested, please read the details on my Google Doc ->

<https://docs.google.com/Doc?docid=0Ad0Y9gPUymOmYWpkdHY3bnFqeDY2XzlxM2Zna25kZDN6&hl=en&authkey=CKe9nvMH>

As well, I wanted to say a *huge thank you* to everyone who helped out with

Hi France,

If its in XLS format I would upload it to a public Google Spreadsheet and use GVIZ to visualize the data.

Michael

Hi Michael,

The data is in XLS - but I am also looking to find a way to automatically pull the XLS from the [FTS site](http://fts.unocha.org/reports/daily/OCHA_R32sum_A905.XLS) (into Google Spreadsheets). This approach would save me from having to download & then upload the FTS XLS each day. GVIS for the actual charts sounds great.

The XLS link is here: http://fts.unocha.org/reports/daily/OCHA_R32sum_A905.XLS (it is dynamically created).

Full detail of what I want to do are here: <https://docs.google.com/Doc?docid=0Ad0Y9gPUymOmYWpkdHY3bnFqeDY2XzIxM2Zna25kZDN6&hl=en&authkey=CKe9nvMH>

Cheers,
Andrej

Hi France,

I had heard (rumors) that your team was working with them - but I do not know the details. Is the work being done at the appeal/emergency level or at a higher level? And, will the work that you are doing simply be displayed on the FTS website --- or will it be "embeddable" on other websites (so our country offices and new emergencies can leverage it)?

My focus for products is really at the country office / emergency level.

Cheers,
Andrej

is there a way to programatically pull data from a web based XLS (such as http://fts.unocha.org/reports/daily/OCHA_R32sum_A905.XLS).

Andrej is trying to create a dashboard of Pakistani relief funds.

M.

Hey Andrej,

Yes, a few years ago dotorg provided a small grant to OCHA to improve their FTS. The ultimate goal was to help OCHA to create a powerful advocacy tool for underfunded emergencies and gaps in funding. Esther wanted to be able to highlight the top underfunded appeals, the top recipient emergencies, donor trends, etc. The idea was to embed Motion Chart on their website (HQs and country level) - but this has not been implemented yet (<http://fts.unocha.org/>).

Michael should be able to address questions that you may have re-[Google Chart tools](#).

Thanks, and good luck!

France

nope there isn't a way to programmatically pull from an XLS sheet. You'd have to put this into Trix first (there are programmatic ways to do this via <http://code.google.com/apis/documents/>).

You can upload a new version to the spreadsheet you created using the API and from there you can have the motion chart feeding off of the Trix sheet.

How large is the file going to get?

Thanks,
 ~Ronald

Thanks France,

No luck with anybody 'cracking' this problem yet. Christiaan has been doing some testing and research. I was hoping to get the summarized data made available in XML and/or CSV, but had not luck. However, they do have a couple XML feeds.

The one XML feed lists all of the contributions made to the appeal - this is the data that will be changing the most often. Thus, if we can find a way to read in this XML feed and summarize it by the sector/cluster, we would be in a really great place! I could settle with adding the other data manually into the Google Spreadsheet --- it would be the overall requirement and the various overall cluster requirements (which remain relatively static).

The feed is: <http://fts.unocha.org/ftswebservice/ftsfeed.aspx?datatype=emergency&id=15913>

I know that **Christian is working on the import - but there is a problem with Google Spreadsheet import** - it doesn't seem to support XML namespaces, so it's not importing directly. He said that he and an engineer are trying to find a script to make it work. If they are able to 'crack' this puzzle, then I think we will have taken a huge step in getting this done!

Cheers,
Andrej

Andrej,

Check out this spreadsheet:

<https://spreadsheets.google.com/ccc?key=0Asb9jTnW9nPsdDZ6ckE0QkFRSXJxTXZPWl9SNEJoUkE&hl=en&authkey=CMW6kIEG>

It's not everything you asked for, but it's a start. It pulls in the data from the [XML feed](#) you provided the other day, summarizes it in a couple ways, and produces a few simple charts.

My colleague Ping wrote a bare-bones script on AppEngine ([xmlltocsv](#)) which solves the problem of that XML feed not playing well with Google Spreadsheets. It converts the XML to a flat CSV file and supplies a URL so that we can use [ImportData](#) to pull it into the "DataImport" sheet of the spreadsheet. From there I use the [QUERY formula](#) (thanks to another colleague, Hillel) to summarize the data in a few ways (you can do others as you wish), and then made a basic chart for each summary. Note that the script only has one "profile" in it right now, customized to convert that one XML file, but it could be generalized in the future to work for other XML files.

Let us know if/when that XML feed is updated, and we will test whether the spreadsheet updates automatically. It should work, since Ping's script should refresh its cache of the CSV conversion periodically (minutes/hours?)... and the ImportData and other formula should update occasionally. I'm not sure of the updating frequency or characteristics, so it would be good to test it. Also, if the number of entries in any of the summary categories increases (ie. more than 10 sectors), then the chart definitions will need updating to pull in more rows.

Of course, this only shows the funding committed, since that's all the XML feed contains. It does not include the funding required data, which is still locked up in those PDF and XLS files. If anyone out there can write a real-time converter for either the PDF or XLS files, and supply us with an auto-updating URL to an XML or CSV version, then we could include that data too.

For now, let me know if you want other summaries/charts, or have other questions.

Cheers,
-Christiaan

The CSV conversion should be no more than 10 minutes out of date when the XML changes. If it is significantly more out of date than this, let us know (it would probably mean that something has stopped working).

Dear all,

We now have the data - but I need the charting help. A "non-techie" gave a great tip and I was able to find a way to get the FTS data in HTML format! With little effort, Christiaan setup a formula in Google Spreadsheets and the dynamic import works seamlessly.

The spreadsheet is here: <https://spreadsheets.google.com/ccc?key=0Asb9jTnW9nPsdE01c3BNR1M5MGFDX1hZRmxhbWdjcmc&hl=en&authkey=CMe11IoD>

The trick is that I need nice charts - something like this: <http://pakresponse.info/img/fts-graph.jpg> Okay, it does not have to be exactly the same, but something that looks professional. Anyone got suggestions or solutions?

Here is my original Google Doc with the outline of what I am looking for: <https://docs.google.com/Doc?docid=0Ad0Y9gPUymOmYWpdkHY3bnFqeDY2XzIxM2Zna25kZDN6&hl=en&authkey=CKe9nvMH>

Cheers,

Andrej

Wow - that is looking great! I was just chatting with Christiaan about needing to clean up the data a bit - largely because the charts put the required amount together with the committed amount --- which makes the bar charts way too long. In each bar, I need to show the amount committed against the total amount.....so:

- dark blue = committed
- light blue = original requested - committed

But - wow. It looks great. I just got your next email - will read through and test tomorrow (it is too late here to think straight any more). Thanks for this.

Do you mind if I come back to you and ask questions?

Cheers,

Andrej

First below is a pie chart example

Second see answers inline

```
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
  <head>
    <meta http-equiv="content-type" content="text/html; charset=utf-8"/>
    <script type="text/javascript" src="http://www.google.com/jsapi"></script>
    <script type="text/javascript">
      google.load('visualization', '1', {packages: ['corechart']});
    </script>
    <script type="text/javascript">
      function drawVisualization() {
        var url = 'https://spreadsheets.google.com/cc?key=0Asb9jTnW9nPsdE01c3BNR1M5MGFDX
1hZRMxhbWdjcm&hl=en';
        url += '&range=A7:F16&headers=1';

        var query = new google.visualization.Query(url);
        query.setQuery('select A,E');
        query.send(handleQueryResponse);
      }

      function handleQueryResponse(response) {
        var container = document.getElementById('visualization');
        if (response.isError()) {
          google.visualization.error.addErrorFromQueryResponse(container);
          return;
        }
        var dataTable = response.getDataTable();
        var options = {'title': 'Funding coverage %', 'is3D': true};
        var chart = new google.visualization.PieChart(container);
        chart.draw(dataTable, options);
      }
      google.setOnLoadCallback(drawVisualization);
    </script>
  </head>
  <body style="font-family: Arial;border: 0 none;">
    <div id="visualization" style="width: 1000px; height: 500px;"></div>
  </body>
</html>
```

I am not too familiar with the data. If you need my help please let me know.

Also recall that you can use the following query language in and outside the spreadsheet

<http://code.google.com/apis/visualization/documentation/querylanguage.html>

- dark blue = committed
- light blue = original requested - committed

Look at the code - editing the options boils down to setting simple properties

E.g., `options['colors'] = ['red', 'pink', 'yellow'];`

But - wow. It looks great. I just got your next email - will read through and test tomorrow (it is too late here to think straight any more). Thanks for this.

np - happy to help out.

Do you mind if I come back to you and ask questions?

of course!!

I've got various wad of things working, but then it struck me:

If ReliefWeb is running Drupal, can't you just install the FEEDS module (<http://drupal.org/project/feeds>) build up a single database table covering all FTS id's, and then chart things 12 ways to Sunday with the Charts module (<http://drupal.org/project/charts>) ?

Subject: Re: [CrisisMappers] Anyone want to help OCHA Pakistan with dynamic, online charting of FTS data?

The link is broken below is the code snippet (don't have time to fix the url).

The code uses the google visualization api.

You can see the full set of charts and options here <http://code.google.com/apis/visualization/documentation/gallery.html>

Are you guys running Drupal - or the plan is to run Drupal for the new site?

And, FTS data is not stored inside ReliefWeb's databases - correct?

Andrej

Hello, Andrej and all ...

For whatever its worth, here's a URL featuring "50 Free Resources for Charts and Graphs Solutions." There might be one on this list – (for both techies and non-techies among us) that works best with the data imported into Google Charts. And perhaps some of us may already have tried a few of the resources listed ...

<http://www.instantshift.com/2010/03/09/50-free-resources-for-charts-and-graphs-solution/>

In the meantime, I thought I'd offer a rough sketch to the group, in case it raises further ideas, or comes close to what is hoped-for of "dynamic online charting". Here is the URL to my "test" ...

<http://www.openroadmaps.com/labs/FusionCharts/>

Some notes:

For non-techies:

- Since I am approaching this more as a designer than programmer, I was inclined to create this by attempting to download the free version of FusionCharts <http://www.fusioncharts.com/> (On Resources List above, scroll down to Flash-based charts)
- Updating seems to involve fewer steps that can be easily handled (save Google data as xls > csv > xml);
- XML had to be manually configured to allow for color changes and data specs;
- Chart can be launched via its own URL link
- For now, preview page is sized at 960px width; each of the funding-allocation pie charts is at 170x170px.
- Head-up alert: this is just a very rough sketch. There are no templates with style sheets. It does not come close to the FTS-Graph sample provided by Andrej. Visual refinements still have to be made, if this is an option worth considering.

For techies:

- Updating the graphic may not be as streamlined and straightforward as the other scripting languages may allow
- It was developed outside of the Google Charts framework and loaded onto a local server.
- There is a reference to Fusion Charts Google Gadget (<http://www.fusioncharts.com/GG/>), which I have not yet explored, although this may answer some questions raised by Andrej
- FusionCharts Website showcases the app working with other scripts other than XML. There may be something here that feels more intuitive for others in the group.

Hope these references help. Many thanks.

Annabel

I wish we were running Drupal. We are only at the earliest stages of our efforts to migrate from the hell we call Domino.

And more importantly, the FTS service is actually managed by the CAP section and is running asp.net.

Andrej, I think Christian Flamm will be the contact for FTS requests.

Annabel,

Very nice design! Looks great, and a lot closer to the original request.

Can I ask you how you're using the XML?... since your manual conversion from Google Spreadsheets > XLS > CSV > XML defeats the purpose of automating all this with automated and shareable data feeds. If you can tell us more about what you need the XML to look like (what do you mean by "manually configured for color changes, and data specs"?), then we may be able to set something up to generate that XML feed straight from Google Spreadsheets.

Cheers,
-Christiaan

Hello

I did some experimenting with the old code I had for generating FTS charts and used some of the code Hillel sent yesterday

This URL:

http://geoapps.rc.rit.edu/misc/fts_charts.html

shows some prototype charts based on the specs sent.

It seems to only work in FF and not in IE, didn't test in other browsers

Comments:

- Charts are rendered in real-time using data pulled from the spreadsheet provided to this group using the Google Chart API

- Design of the charts is done programatically using javascript. Basically, I wrote code to loop through the rows/cols to pick out only the data values needed ,and then render tag HTML strings for creating the charts. View the source of the document to see how it works.

- very much a prototype, need to tweek the scaling/sizing and other design issues plus some debugging to make it look better and correct for final presentation.

My thoughts on why do it this way -

- since the charts are basically images, they can be "widgeted" into other web sites easily

- Have Google involved in these discussions to support using their chart API
- no plugins needed

I didn't want to get much further into this seeing other efforts are developing.

If there is interest in going further down this road, let me know.

best regards

Brian Tomaszewski
