

As OCHA launches JIAF 2.0, a revamped methodology to help the humanitarian community assess the multi-faceted needs of people in crises, we asked Herbert Tatham from APMB-NAARAS and the OCHA lead on JIAF about the updated tool, and specifically how it is an improvement vis-à-vis the previous JIAF.

Finally, JIAF 2.0 provides a simpler, more streamlined, and participatory approach to needs analysis, through a three-stage process where the results of collaborative analysis are stored and organized online for easy access to sectoral and intersectoral evidence.

JIAF 2.0 has been developed through a partnership with UN and clusters partners, specialized assessment and analysis organizations and a group of donors. The partnership included a technical methodology working group (MWG), an JIAF Advisory Group (JAG) and a Steering Group. This partnership has spearheaded the changes to the JIAF methodology and has supported awareness raising at global and country levels and now is advocated for its consistent application for HPC 2024.

With then new, lighter version of the JIAF, in addition to robust, transparent process to analyze needs, JIAF 2.0 is contributing to organizational efforts of making the HPC lighter and more fit for purpose.
