

MAKING DECISIONS – AND FAST *at the onset of a* DISASTER

In the **first hours and days** of a disaster response (or even before, in the case of cyclones) it is crucial to make

DECISIONS

FAST

...that require **answers** to the following **questions:**

How many people will be affected?

 How many of those people are particularly vulnerable? 

What is the potential scale of the  emergency and how big will the response have to be? 

Do we need  deployments,  field offices,  emergency funds?

What are the  priority geographic areas? What are the priority sectors and needs? 

How?

The JADE, a regional initiative between the **Pacific Disaster Centre (PDC)**, **WFP** and **OCHA** is trying to address this data gap using state-of-the-art modeling, secondary data, and close cooperation with responding agencies.

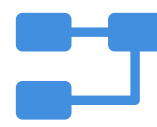

Joint Analysis Disaster Exposure

Coordination and advocacy role in emergency response

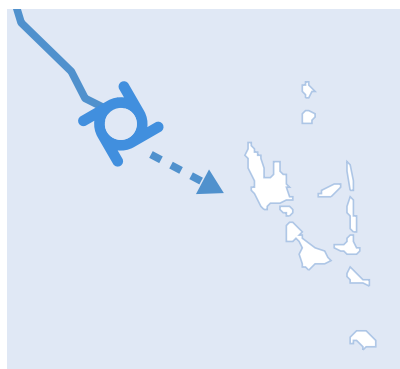

Vulnerability expertise with secondary data

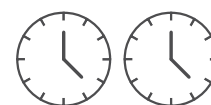

State-of-the-art modeling capacity

The JADE Process

When a disaster occurs or is approaching, OCHA regional office is in constant communications with the UN country office as well as PDC and WFP.

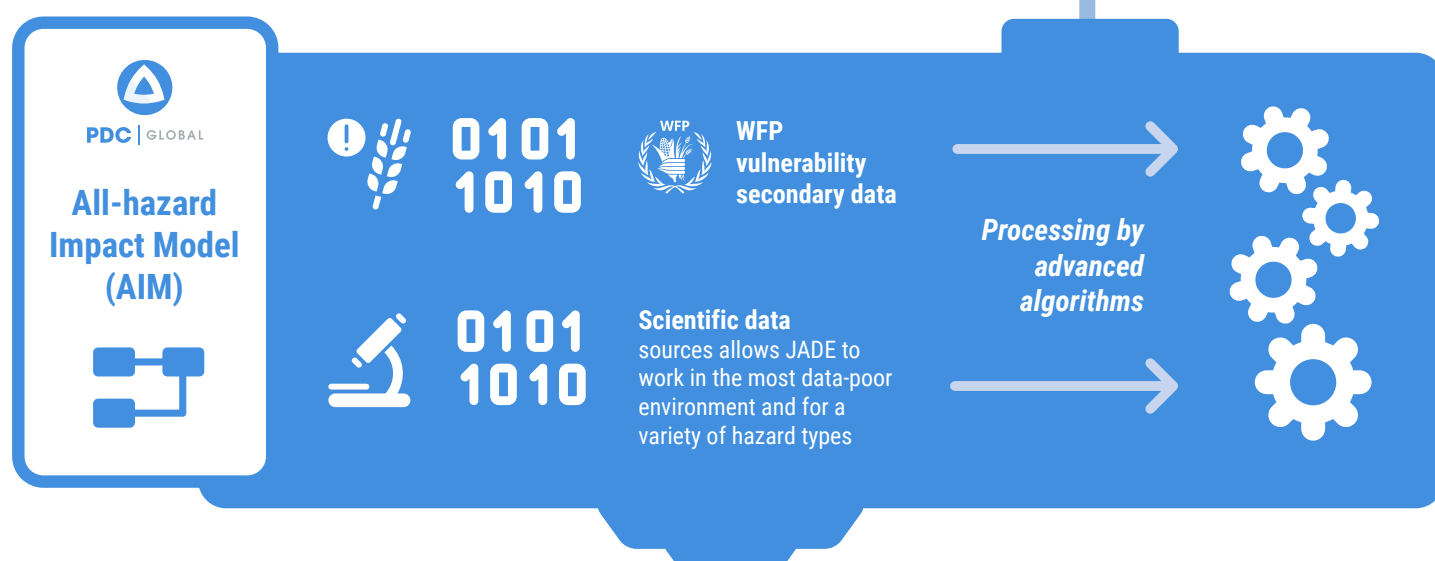

Within
24
hours

When the impact of a disaster exceeds certain agreed thresholds, the JADE is activated.

ACTIVATE

JADE-provided estimates

Population

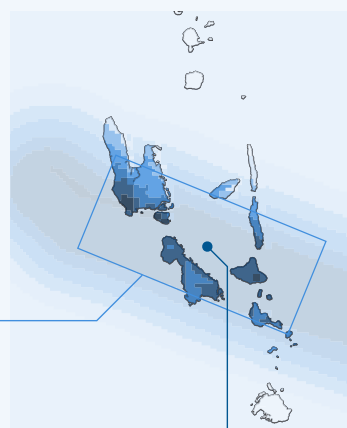

The number of people living in ALL areas affected by the disaster.

The number of people living in the worst affected areas.

The JADE analysis goes beyond exposure, to look at who, among those living in the worst affected areas, was already **vulnerable** and therefore most likely to be in need of international humanitarian assistance.

Vulnerability is calculated using indicators such as multi-dimensional poverty or food insecurity

Age/sex disaggregated

Urban and rural populations

Time of day

Assets and infrastructure damage estimates
