P-Codes -Spatial Data Standards for Kosovo.New and Revised, April 2000

Pcodes – Unique Village Identifier Codes.	UNHCR	104kb	PDF	28 AUG 99
Pcodes-2 New and Revised NEW !	HCIC	455kb	ZIP	05 MAY 2000
Pcodes-2 Mapinfo and Arcview data NEW !	HCIC	4.6Mb	ZIP	05 MAY 2000

P-codes – What are they ?

“P-code” is an abbreviated term for “Place Code”. P-codes were developed for Kosovo to provide a unique numerical code for each town, village and administrative unit. Using a numerical code avoids the problem of choosing between ethnic names, between Cyrillic and Latin alphabets, and between various spellings of place names.

P-codes were initially developed in 1998 in response to the Kosovo emergency. In preparation for civil registration in 2000, an exercise was done to verify the current boundaries of municipalities, districts and settlements; the location and names (in Serbian and Albanian) of cities, towns and villages and the location of registration sites and boundaries. P-codes are based on data from the Yugoslav government and revised and expanded to reflect the reality on the ground in the year 2000.

P-codes are developed and maintained by the Humanitarian Community Information Centre (HCIC)

What are spatial data standards?

P-codes are part of a data management system that allows tabular data from various agencies to be shared. When P-codes are used as a primary key in a data set, multiple data sets can be combined for analytical purposes. Because P-codes have a spatial locator built in the code, data attached to P-codes can readily be displayed on maps using Geographic Information Systems (GIS). The Humanitarian Community Information Centre produces mapped data sets for a wide variety of agencies and purposes

Who

codes?

accepted as the data standard for Kosovo by UNMIK, UN Agencies, IMG, KFOR and OSCE.
