

About the Map Centre

8 Apr 1997

In the Map Centre, you will find five types of maps:

- ReliefWeb template maps of geographical areas containing basic information: typically, cities, roads, administrative boundaries, and lakes. You may wish to use these maps as reference for geographical information, or to print them and add more information yourself. These maps are in [GIF](#)-format, and the file size is kept small to make the transfer and loading time short. Under the title Map Sets at the bottom of the page, the same maps are available in metafile format as a [ZIP-file](#). This you can download and decompress. Metafiles can be opened and edited in many programs (like Microsoft Word, Powerpoint, Paintshop Pro).
- Humanitarian community information maps are produced by ReliefWeb, and also collected from other organizations and government sources like the WFP, ICRC and USAID. If you have information or maps which we could include in this map service, please contact us. E-mail address: maps@reliefweb.int
- General interest maps from various sources. These are of varied formats and sizes. The size of the map is indicated in brackets. If you have a slow connection or little capacity in your computer, avoid loading very large files. Remember that your [browser](#) has a **Stop** button for interrupting processes that take too much time.
- Clickable maps: some maps contain links to documents in the ReliefWeb. For example, if you click on flood disaster areas on a map with the link you get the situation report of that area.
- Links to maps on other Web-sites: continuously updated weather sites, sites with large collections of satellite images, and some other sites with a good collection of relevant maps. Some of the links refer to very large images, thus retrieval time may be long.
