

UPDATE: COMPLETE

This project is complete - thanks to the great efforts by Google and CrisisMappers

Translating a Google Spreadsheet to a Google Map

Overall desire: translate dam level data from the [Pakistan Meteorological Department](#) (PakMet) into a Google Spreadsheet that automatically updates a Google map showing the current status and change of the given dams.

Final product: obviously a Google Map (one that can be 'owned' by OCHA and/or the Pakistan Meteorological Department) which shows the status of various dams in Pakistan.

- Example product is the [static map](#) that [MapAction](#) produced in ArcGIS
- Before starting any work, please ensure that you have reviewed the [static map](#) and have read everything below.

Current data:

- [GPS coordinates of the dams](#) are available for download.
- [Data source XLS](#) that MapAction used to create their map is available for download. They compiled this XLS from the two data sources below
- Flood limits of the various dams: http://www.pakmet.com.pk/FFD/index_files/floodlimits.htm
 - Note the categories: Low, Med, High, Very High, Ex. High
 - This data shows the various dams and their capacities
- Current dam levels are found here: http://www.pakmet.com.pk/FFD/index_files/hydro.htm
 - These charts provide the current level and trend
 - [Skardu](#) is at 192600 - in the data source XLS, this value refers to the "Current Flood Level"
 - Chart displayed is visually interpreted to determine the "Flow Trend" value in the data source XLS.
 - Note that it shows a "green" / steady level of water - this matches the symbology on the resulting map
- catchment areas (areas that drain into each dam) http://www.pakmet.com.pk/FFD/index_files/catchment.htm
- rainfall data in HTML table http://www.pakmet.com.pk/FFD/index_files/rainfall.htm
- 2 dams, HTML table data: http://www.pakmet.com.pk/FFD/index_files/dam.htm
 - can more dam data updates be put into HTML tables instead of the GIF charts?

Symbology:

- The static map was using pre-defined symbols that match the colours used by PakMet.
- The [standard symbols](#) are available for download.

Request:

- Develop one Google Spreadsheet that closely matches (with necessary additions) the

- MapAction Data Source XLS (obviously needs to include the GPS points as well).
- Develop a Google Map that dynamically generates the dam level map from that Google Spreadsheet showing the correct symbols.
 - When clicking on the respective icon (on the Google Map) will show typical dialog. Content of each dialog should contain relevant metadata for that respective point (see the chart in the [static map](#)) plus space for textual information (if we enter it into the Google Doc).
- Need to be able to embed the Google Map onto any website (and given ownership of that map to multiple individuals/organizations - like a Google My Map)

What has happened so far:

- @kate30_CU [offered to send a script](#). No action taken.
- @jabranr provided a [sample Google Doc](#) that translates to a [sample Google map](#).
- @room306 offered connection to [International Centre for Water \(ICWater\)](#). Responded asking for contact details.
- @crisismappers suggested emailing instructions to their network. Message sent.
- Message from Google Outreach that they might be able to help - will schedule a call
- @nijel_mapping provided 32px square transparent PNGs of the [River Level Status Flow Icons](#) - they're available for download [here](#)
- csadams@google.com working on the map, with help from jd@nijel.org

Product:

I have a basic KML generator working...

KML generated using [this spreadsheet](#)

Google Maps view [here](#)

To view in Google Earth, copy/paste this into Google Earth:

```
<NetworkLink>
  <name>Pakistan Dam Status</name>
  <open>1</open>
  <Snippet maxLines="0"></Snippet>
  <Link>
    <href>
      http://spreadsheets.google.com/pub?key=0Asb9jTnW9nPsdEV0Nm9Bemh2OXZPV2hCYmtITWh3S2c&output=txt&range=kml
    </href>
    <refreshMode>onInterval</refreshMode>
    <refreshInterval>7200</refreshInterval>
  </Link>
</NetworkLink>
```

- The "Data" sheet is the primary sheet for regularly updating the data.
- Any questions, comments, or editor access requests, please contact Christiaan Adams: csadams@google.com
- @jabranr: manually updating this data at [local.com.pk](#) (used as source tool at [Google Crisis Response](#))

Please add details here - so that people can see what is being done. I personally like to think of a Google Doc as a user friendly wiki :-)
