Requesting Assistance - from OCHA Pakistan

Dear all,

I am on surge Information Management surge to OCHA Pakistan. We have a [couple projects](#) that I figured that the Crisis Mapping community may be able to help out with.

1. [Dynamic River Level Mapping](#). Right now, the [Pakistan Meteorological Department](#) (PakMet) provides various data on the water level at various dams around the country. MapAction has produced two version of [the map \(in static format\)](#) already, but it would be great to have it setup so that the data could simply be placed in a Google Spreadsheet and then a Google Map is automatically updated. Full details of what is required and what has been done, is [online here](#).
 - Note that the static maps were taken to the PakMet and analyzed for what dams could be (temporary) closed altogether so as to stop water flowing from the north and augmenting the floods in Punga and Sindh.....so, this product is being used and could make a difference.
 - There are already future ideas/questions like how to incorporate rainfall forecast.....but, let's take this one setup at a time.
2. [Converting OCHA's Symbol Font to GIF](#). We would like to convert the OCHA Symbol font into individual, transparent GIF. An OCHA Intern had previously done some research but with little success. If anyone knows the best way to do this and/or is willing to convert them for us, we would greatly appreciate it.

Both documents linked above are fully editable by anyone.

Cheers,

Andrej

Hello from Pakistan,

Just an FYI of a request that I sent to Crisis Mappers for help to do some dynamic mapping for the OCHA Pakistan office (I am on surge).

If you are interested and/or can help somehow, please let me know.

Dear Andrej,

I am not sure if this can be any help but let me try.

There is a local Ushahidi deployment lead by Faisal Cohan. Our team is assisting their team based on our lessons learned from Haiti and Chile. The site is www.pakreport.org and will go public probably today. We updated the list of categories and through intensive media campaign we want to raise awareness among the populations what type of incidents they can report. We also got in initial contact with Map Action team who could be following especially the Logistics category in order to get up to date reports from people on the ground. I believe Faisal's team could add any specific subcategory that might help to track data you need.

However, it is difficult to predict right now what type of reports we will be receiving and I am not sure, if such reports could be any help to you.

Please, let me know if you have any ideas and I will do my best to implement them if necessary,

best

Jaro
Ushahidi Haiti Project

Hi Jaro,

Yes - both MapAction staff and I met with Faisal the other day. I am on Skype right now with Patrick M.....here is what I said to him about possible Ushahidi use in regards to conversations with MapAction today:

we talked about Ushahidi for having people text in the water level of where they are. Right now, we only know the river level --- but that does not give us an idea of the depth away from the damns.....interesting idea?

Faisal: would that be an appropriate category/sub-category? (if it is not already there). Obviously it would be a time sensitive report.

FYI: like the domain name (much better than the crowdmap.com address)

Cheers,

Andrej

I think that we can definitely add it as a subcategory, how about simply "Water level in your location"?

As I said, it would be important to get the message out so that people know that this is something they could report. Especially if this is a critical information needed these days.

@Faisal I think you can mention this on your upcoming meeting with internews, if they will be helping pushing message out through local media, it could be mentioned as one of the current priorities. Plus would be useful to give instructions to the team of volunteers that after such campaign they can expect this type of messages and give them priority.

Can't promise that this would work to an extent that could be useful, but if we managed to get the message out, why not

To: andrejverity@gmail.com

Wed, Aug 18, 2010 at 7:52 PM

Hi,

As a civil engineering student and CrisisMapper, I'm familiar with using sensor data, making hydrology maps, and getting the Google Maps API working and embeddable.

So I can offer help to your project, but I'm in Uganda, then travelling, until Monday.

Tomorrow, I can go into the city, get better internet, and make you an HTML map. The dams will appear on the map with icons depending on their maximums and the latest level you set on the page. When you click a point, it will show the up-to-date graph, for example http://www.pakmet.com.pk/FFD/index_files/inflow/tarbela.htm

The data will be in JavaScript, but you should be able to expand and update it. Each dam might look like this:

```
addDam({  
  name: "tarbela",  
  latitude: 34.0897772,  
  longitude: 72.702026,  
  exhigh_red: 800000,  
  veryhigh_orange: 650000,  
  latestLevel: 600000  
});
```

But for this to be more useful, I think you need a server that reads the latest data from the official Pakistan sites to keep your map and KML updated. It'd be good to include the other data from the Pakistan site (some links added to data sources in the Google Doc). Starting Monday, we

can try setting that up on Google App Engine, which is free.

Hi Christiaan,

My group NiJeL also signed up to do the Dynamic River Level Mapping work that Andrej requested, but as our plan was to customize the Spreadsheet Mapper tool that you developed, we'd be happy to defer to your expertise. Let me know if you plan on doing this work, and if so, if you could use any help on this front.

Thanks!

Andrej,

I can do the mapping for you. We may be able to use the Spreadsheet Mapper tool that I helped build to make KML from a Google Spreadsheet, or I can do a custom one to get closer to your static map. Will be in touch off-thread for some details on the data flow.

About the icons... I don't know if there's an automated way to do it, but it can certainly be done in Photoshop... it's just a lot of manual labor. I'll see if I can find someone around here to do it, but if anyone on the list has Photoshop and some free time, I'm happy to talk them through the process.

Where can I reach you to discuss?

Hi Nicholas,

Thanks for the response. Sounds promising. One big thing to keep in mind is that it needs to be as simple as possible --- that is why I asked about mapping directly out of Google Docs ---- if I want to train the government to use it, I would just have to teach them to type into Google Spreadsheet (which is very close to XLS) --- then, the map is already updated for me.

If you can develop something nice a simple, I would be excited to use it!

Feel free to put some info into the Google Doc that I have online - so people know what you are doing. Others have come forward and I am just trying to get everyone to put their info on the doc so no one duplicates (and people can work together).

Cheers,

Andrej

Hi Jim,

If you already have an automated solution underway, great! If you are planning to do manual work or are looking for scripting tools to solve the problem in an automated way, I suggest ReportLab and Python — I've had success using them previously to render TrueType fonts to bitmap images.

Great, thanks for letting us know. We'll concentrate on the map then.

Jim, when I imported the PDF into photoshop (one technique of extracting the images), I noticed that in addition to the black images, a number of the icons included white areas to block out parts of the image. For example, see the four icons under "Damage"... it looks like they use the same building icon, with various amounts blocked out by white, so you should check the TTF files to see if each of those variations is represented or not. Just FYI, so it doesn't come back to bite you later. :)

Re: Converting OCHA's Symbol Font to GIF: TEST

Hello Andrej, Christiaan, Ping and JD:

In respecting Patrick's preferences that very specialized or specific topics be discussed off-thread, thought I would go ahead and email these preliminary samples to you. If I have missed anyone who should be cc'd, please do let me know.

Attached are two GIFs:

Test01 is saved directly from Illustrator;

Test02 is saved directly from Photoshop.

A few questions:

- (a) These are saved with the default Gif 128 no dither. do you have preferences for other settings?
- (b) Are there standard sizes (example: 80px x 80px) for each icon?
- (b) They are grayscale/b+w: do you have preferences on color?
- (c) I just called this "helm". How would you recommend naming conventions for each icon?

Hope these are close to what you have in mind. Many thanks for your advice and direction.

Annabel,

These look good so far, except that the sizes and location (off-center) of the image on the transparent background are not consistent.

- a) I don't have preference settings... that sounds fine.
- b) 64x64 is the best practice for KML and Google Maps, though 32x32 works well too.
- c) b/w or greyscale should be fine, since it looks to me like they are all black and white (actually, black and transparency... the white in a few of them should be turned to transparent).
- d) I don't know about naming. I would go with the names given to each one on the PDF, unless Andrej requests otherwise.

I guess another question for Andrej is whether there's a reason he specifically wants GIF. PNG would provide better anti-aliasing than GIF, but either should be ok.

Cheers,
-Christiaan

Hi all,

Hope I got everyone necessary on this email - thanks for the quick responses! I had exchanged a couple emails with Jim and Matt (of MapAction). One main update from me: turns out that MapAction has the files in PNG format (bound and unbound). I have added them to the same record online: <http://fileupload.unocha.org/upload.aspx?publicID=>

[u180810052521oky2Jjkw81](#) I am still interesting getting GIF format --- but was not sure if making GIF from PNG was easier?

Here are answers to your questions Annabel - similar to what I responded to Jim.

A few answers:

(a) These are saved with the default Gif 128 no dither. do you have preferences for other settings?

---- none that I know of - I am not a graphics person so I am not really even sure that you mean. I need them for inclusion in reports (DOC, PPT) and to be used online (e.g. Google Maps).

(b) Are there standard sizes (example: 80px x 80px) for each icon?

---- no standards, but I seem to have few that are 95px by 95px (not sure why - see the attached ones) - which seems like a nice size (gives room to use it in multiple ways). At the same time though, I would like to have them in a size that could be easily 'downsized' to 64x64 or 32x32 (for use on Google Maps/Earth!).

(c) They are grayscale/b+w: do you have preferences on color?

---- take a look at the ones attached - I will let you be the judge

(d) I just called this "helm". How would you recommend naming conventions for each icon?

---- see the attached PDF file which (hopefully) lists them all --- you can name according to what they are --- perhaps OCHA-categoryname-symbolname.

Again - thanks for all the responses and help!

Awh: just got Christiaan's email: to be completely honest, I cannot remember the reason why I wanted them in GIF format (I went through a similar exercise in the Philippines with icons) ---- I think that there was an OCHA tool that I could not load PNGs into.....but would take GIF. Either way, I will be happy to have both....and use whatever works best in a given situation.

Cheers,

Andrej

Great, thanks for letting us know. We'll concentrate on the map then.

Jim, when I imported the PDF into photoshop (one technique of extracting the images), I noticed that in addition to the black images, a number of the icons included white areas to block out parts of the image. For example, see the four icons under "Damage"... it looks like they use the same building icon, with various amounts blocked out by white, so you should check the TTF files to see if each of those variations is represented or not.

Just FYI, so it doesn't come back to bite you later. :)

masims@mapaction.org

Andrej and Christiaan, thank you for the direction.

I will pull up the PNG files from MapAction and convert into transparent GIFs from there. From what I recall, PNG formats are less popular than GIF and JPEG because not all Web browsers display PNGs correctly, and because PNG-24 files can be relatively large in file size. Jim and Matt, do jump in and correct me if I'm wrong on this.

Nevertheless, I will go ahead and create GIFs in different pixel-sizes: in this way, you can have options...

Give me the next

Hi all,

Hope I got everyone necessary on this email - thanks for the quick responses! I had exchanged a couple emails with Jim and Matt (of MapAction). One main update from me: turns out that MapAction has the files in PNG format (bound and unbound). I have added them to the same record online: <http://fileupload.unocha.org/upload.aspx?publicID=u180810052521oky2Jjkw81> I am still interesting getting GIF format --- but was not sure if making GIF from PNG was easier?

Here are answers to your questions Annabel - similar to what I responded to Jim.

A few answers:

(a) These are saved with the default Gif 128 no dither. do you have preferences for other settings?

---- none that I know of - I am not a graphics person so I am not really even sure that you mean. I need them for inclusion in reports (DOC, PPT) and to be used online (e.g. Google Maps).

(b) Are there standard sizes (example: 80px x 80px) for each icon?

---- no standards, but I seem to have few that are 95px by 95px (not sure why - see the attached ones) - which seems like a nice size (gives room to use it in multiple ways). At the same time though, I would like to have them in a size that could be easily 'downsized' to 64x64 or 32x32 (for use on Google Maps/Earth!).

(c) They are grayscale/b+w: do you have preferences on color?

---- take a look at the ones attached - I will let you be the judge

(d) I just called this "helm". How would you recommend naming conventions for each icon?

---- see the attached PDF file which (hopefully) lists them all --- you can name according to what they are --- perhaps OCHA-categoryname-symbolname.

Again - thanks for all the responses and help!

Awh: just got Christiaan's email: to be completely honest, I cannot remember the reason why I wanted them in GIF format (I went through a similar exercise in the Philippines with icons) ---- I think that there was an OCHA tool that I could not load PNGs into.....but would take GIF. Either way, I will be happy to have both....and use whatever works best in a given situation.

Cheers,

Andrej

_ *Re: Converting OCHA's Symbol Font to GIF: TEST*_

Hello Andrej, Christiaan, Ping and JD:

In respecting Patrick's preferences that very specialized or specific topics be discussed off-thread, thought I would go ahead an email these preliminary samples to you. If I have missed anyone who should be cc'd, please do let me know.

Attached are two GIFs:

Test01 is saved directly from Illustrator;

Test02 is saved directly from Photoshop.

A few questions:

(a) These are saved with the default Gif 128 no dither. do you have preferences for other settings?

(b) Are there standard sizes (example: 80px x 80px) for each icon?

(b) They are grayscale/b+w: do you have preferences on color?

(c) I just called this "helm". How would you recommend naming conventions for each icon?

Hope these are close to what you have in mind. Many thanks for your advice and direction.

Hi All,

Attached are the bounded OCHA symbols reduced to 64x64 in GIF. I can do the unbounded symbols shortly.

I can't remember why I converted them to png files originally (I think it to do with transparency). I use the symbols a lot in Google Earth and by having a white background within the border does mean that you can apply a colour to them (or at least a coloured background).

Matt

Hi Andrej,

Just taking this offlist.

If the imagery is available using a permissive license, e.g. Creative Commons, then we should be able to incorporate the OCHA symbology into Sahana, and be able to redistribute the symbology with our code for future events.

Are you able to let me know the licensing conditions of the symbology? I am a little hesitant to include resources without having a clear definition of usage terms. I had a quick look in one of the linked zip files, but there was nothing there regarding licensing or usage rights.

Cheers Gavin
Director, Sahana Software Foundation

Hi Omer,

Yes - in the past I have had a couple instances where I could not use PNGs. Note that I did not have the PNG files - it turned out that MapAction had already created them --- so I added them to that record for people to see.

Also, from what I understand PNG formats are less popular than GIF and JPEG because not all Web browsers display PNGs correctly, and because PNG-24 files can be relatively large in file size.

Cheers,

Andrej

Data in the Google Spreadsheet will have to be updated manually. The ideal future would be to have the PakMet actually do the data entry themselves onto that Spreadsheet.....but, one step at a time.

Cheers,

Andrej

Andrej and Omer,

No, as Andrej said, the data is not automatically updated in the spreadsheet. It needs to be manually typed into the Data sheet.

But... if PakMet has a publicly accessible feed (XML, etc.) of the data, or even an HTML table on a web page that they keep updated (and in the same format), then I can probably set up the mapping spreadsheet to pull the data directly from there... automatically. If you know of such a feed or KML, please send me the URL.

Cheers,
-Christiaan

Hi Christiaan,

Any way to include a legend with Google Maps like this?

I am going to 'embed' the map on our website today (hopefully), but need to sort out the legend ---- thinking just to have the map take 3/4 of the page and then a column with the legend.

Cheers,

Andrej

PAKMET etc i believe are not using any xml or feeds for that matter.

Let me see if i can talk to some one there to help out on this end. Alternatively, maybe one person from their office can be authorized and mandated to update this data daily.

Let me see who I can find.

Omer

Would be great if someone from PAKMET would be interested in updating the data in the Google Spreadsheet.

They would also be very welcome to embed the Google Map onto their site! I emailed Christiaan to see if there is any way to include a legend on a Google Map.

Cheers,

Andrej

There's no built-in way to generate a legend in Google Earth or Maps, beyond the listing that shows up in the left hand column.

For an embedded Google Maps, you can put the legend on another part of the web page, as an HTML element, or as an image. For Google Earth, you'll have to create an image and add it to the KML as a screen overlay. Let me know if you need pointers on how to do that.

For the maps version, I've put a section in the spreadsheet that generates a basic HTML table with all the icons. You can find it on [the "styles" sheet](#) in the spreadsheet. Put that in any web page ([like this one](#)) and you'll get a simple legend.

Hope that helps,
-Christiaan

Andrej,

I also just tweaked the balloon layout HTML a bit to make it take less space vertically... so the whole balloons can be seen on smaller size embedded maps.

I'm headed to bed... catch you on the other side. :-)

Hi Andrej,

Just checking to make sure you got the symbols converted as you requested. If so, glad it was taken care of.

Hi Ping,

I was just going to do it by hand in Gimp and not mess with trying to figure out the automation. If you can steer me to a quick fix I will look at it.

Christiaan , and Ping,

please excuse me interrupting, Jim Cory from the CrisisCommons list has already offered to do the icon conversion for Andrej.

I'm CCing Jim on this message, you may wish to collaborate or exchange tips.

Thanks, Spike!

Hi Jim,

If you already have an automated solution underway, great! If you are planning to do manual work or are looking for scripting tools to solve the problem in an automated way, I suggest ReportLab and Python — I've had success using them previously to render TrueType fonts to bitmap images.
